Distributional Effects of Energy Transition: Impacts of Renewable Electricity Support in Germany

Karsten Neuhoff

Paris, 9.4.2014

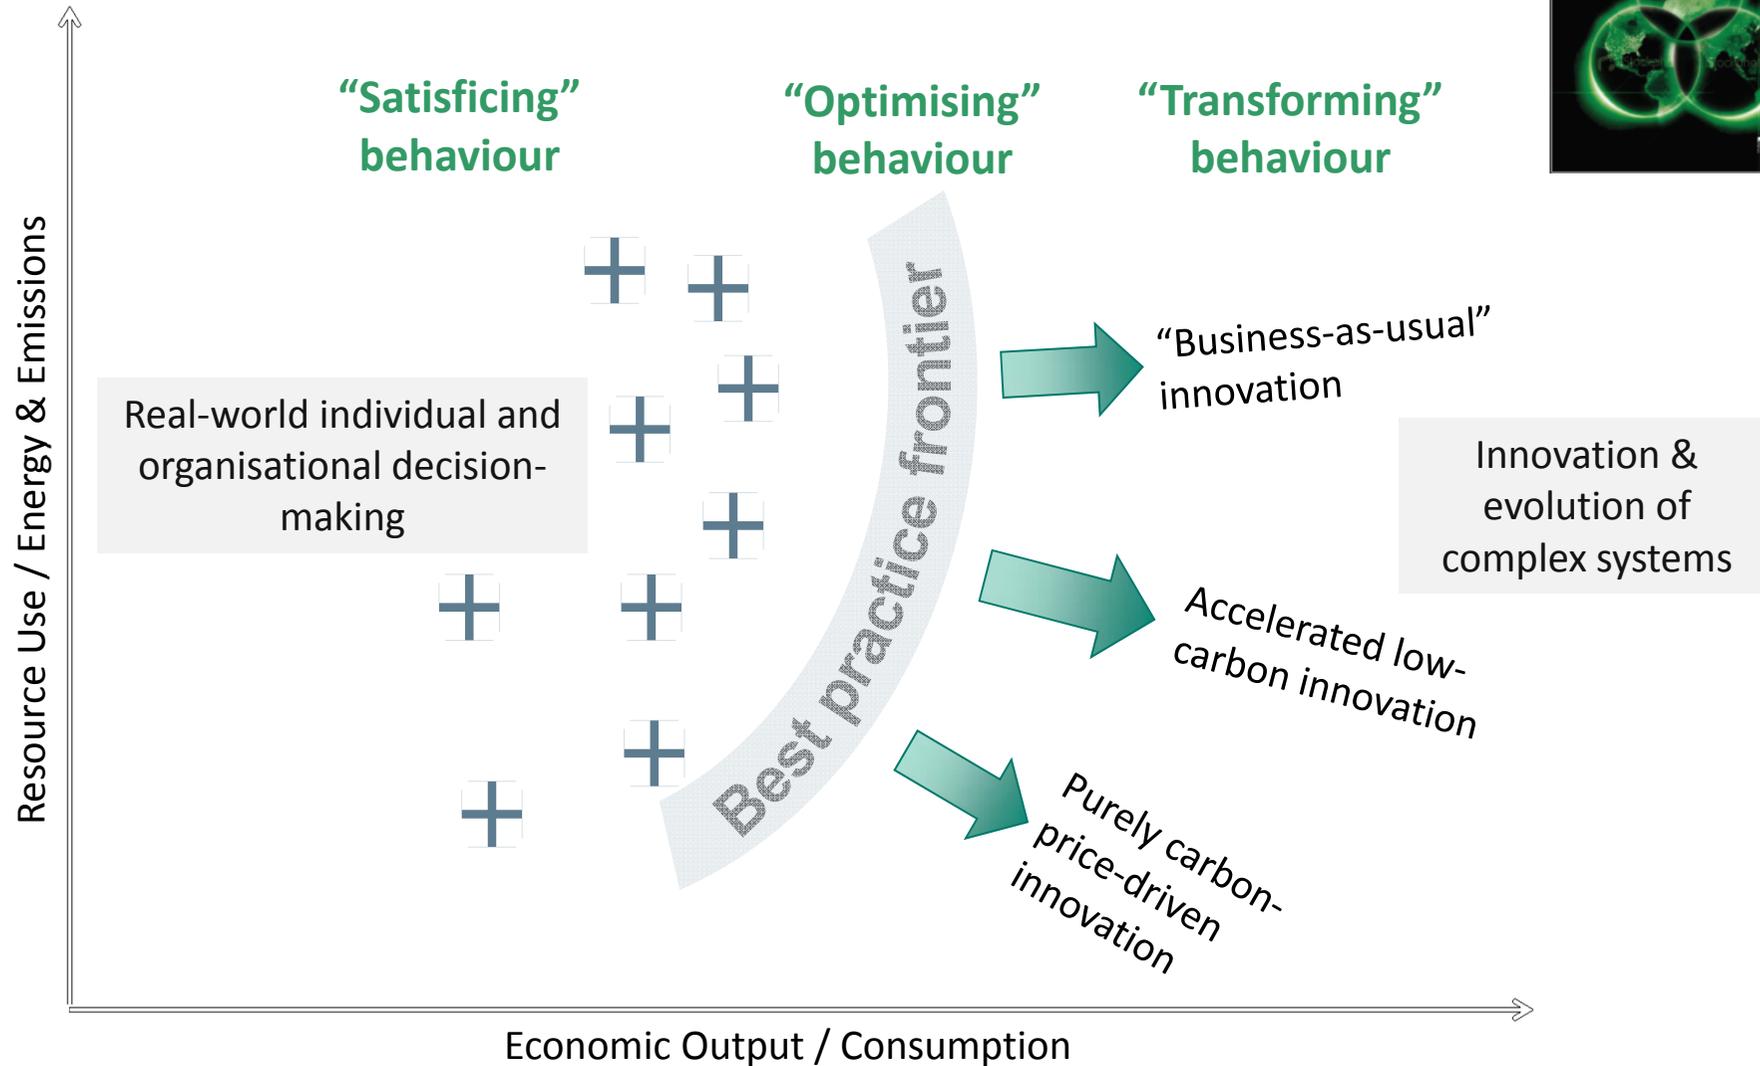

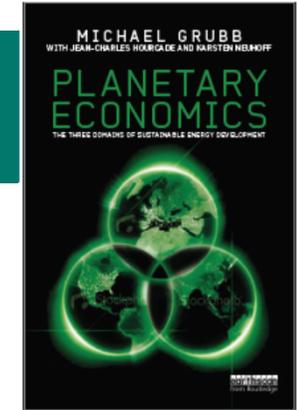

1

The energy challenge of decarbonisation

Source: Grubb, Hourcade & Neuhoﬀ (2014): Planetary Economics, Energy, Climate Change and the three domains of sustainable development. *Routledge*.

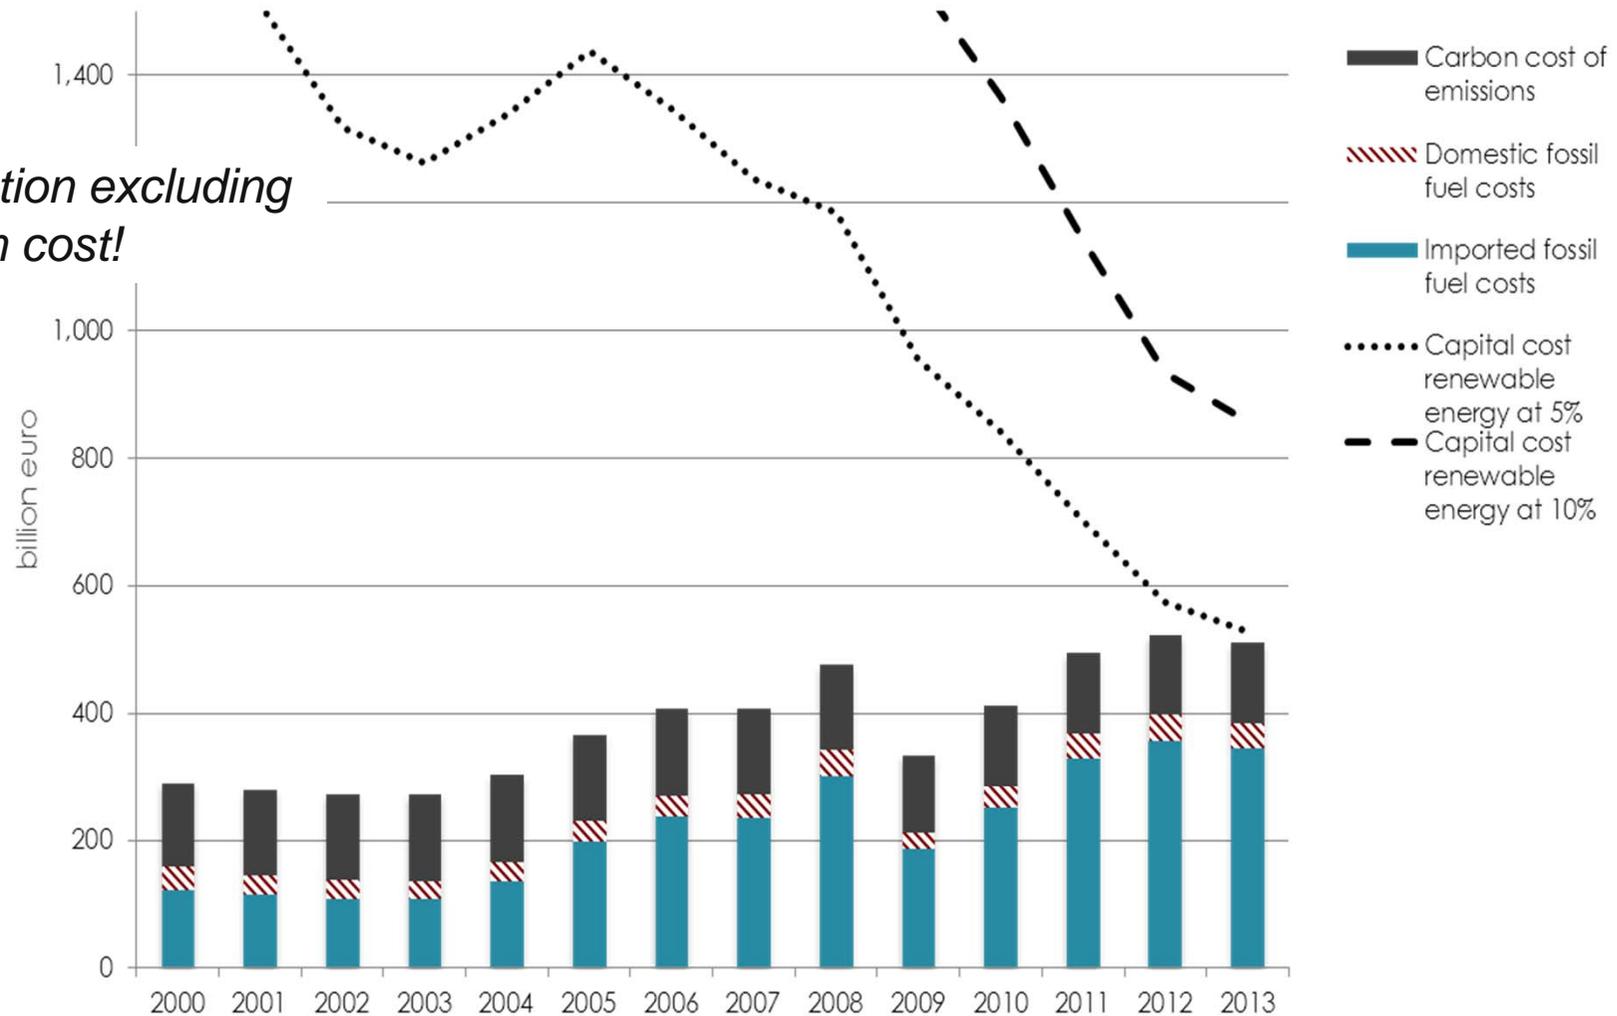

Three domains of policies

Source: Grubb, Hourcade & Neuhoff (2014): Planetary Economics, Energy, Climate Change and the three domains of sustainable development. *Routledge*.

The annuitized costs of new Renewable Investments - compared to fossil fuel import bills

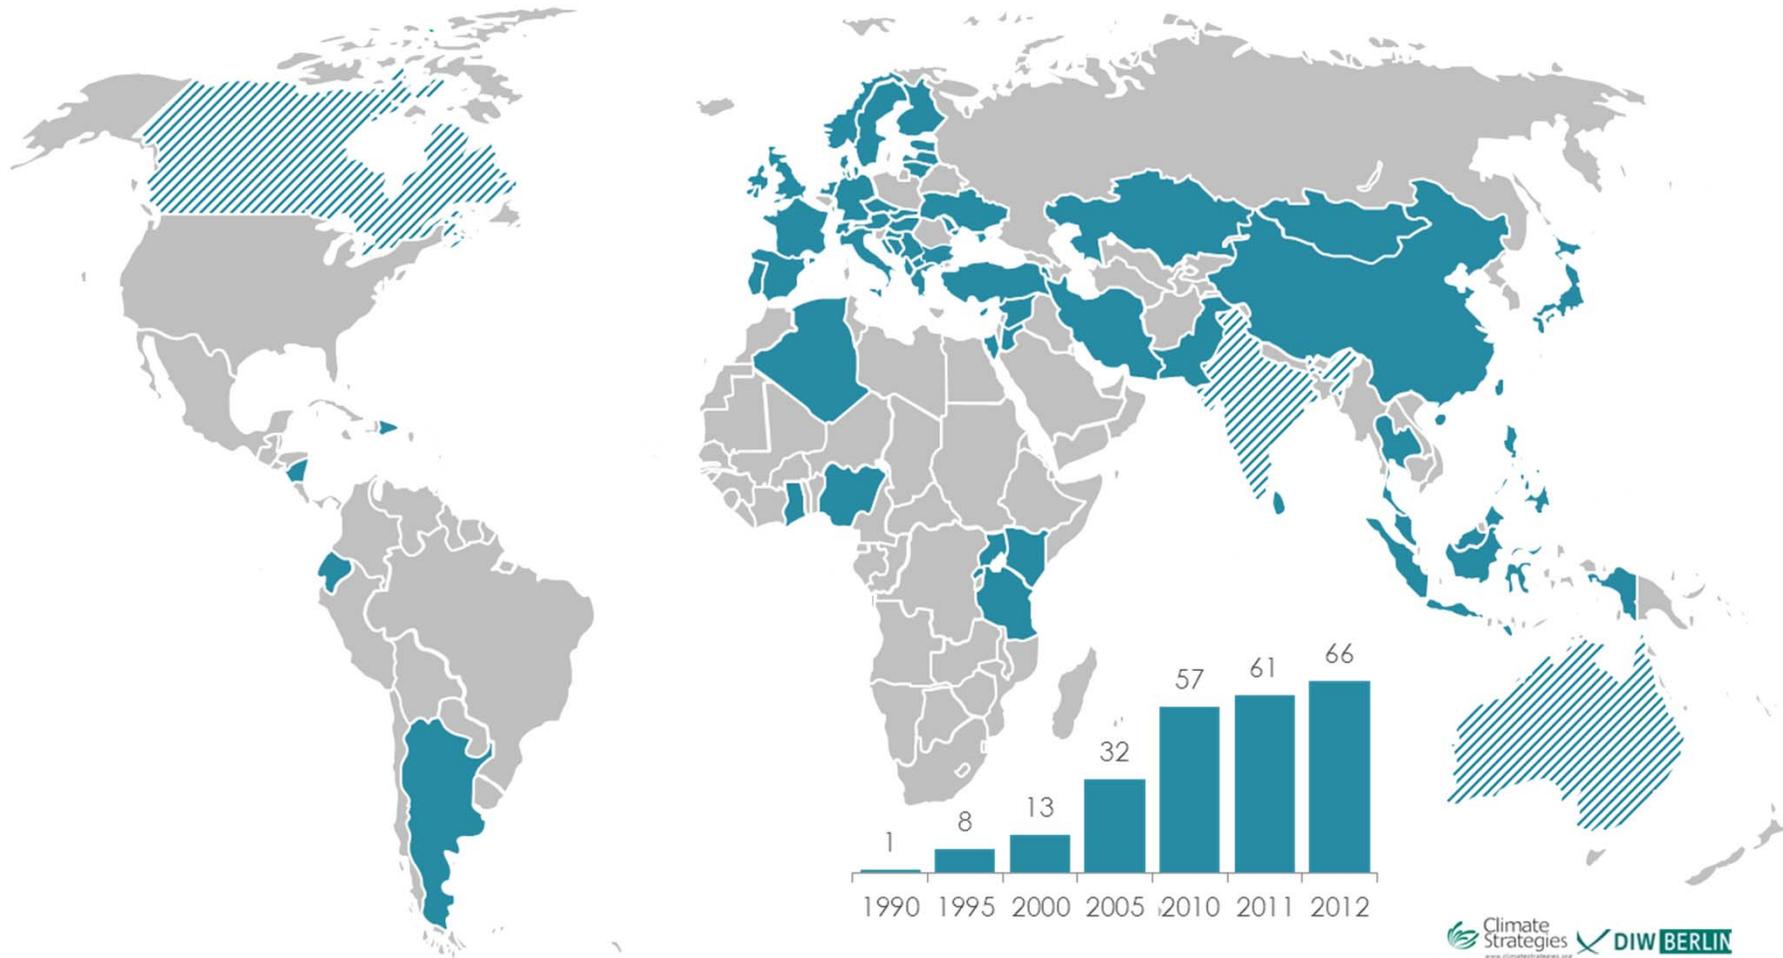

*Illustration excluding
system cost!*

Assumptions: 2% Inflation, Fossil conversion losses 50% 66% of energy from on-shore Wind and 33% Solar

2

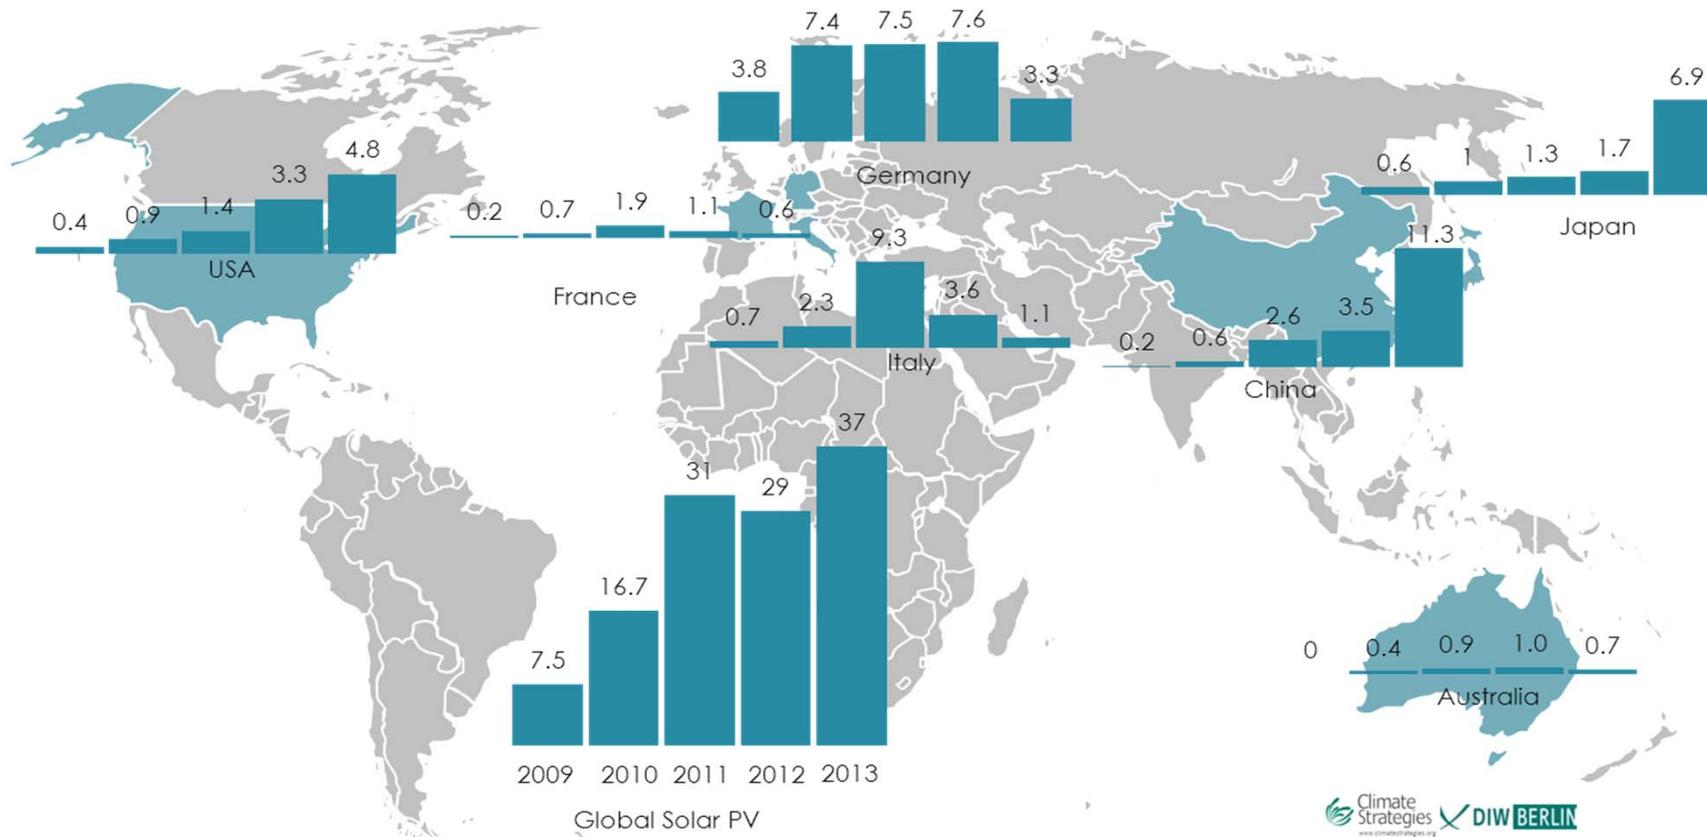

A leading group of countries facilitates investments in renewable energy Example: Feed-in tariffs

DIW Berlin Calculations based on REN 21, 2013.

A leading group of countries is modernizing energy provision and use: Annual construction of photovoltaic 2009-2013.

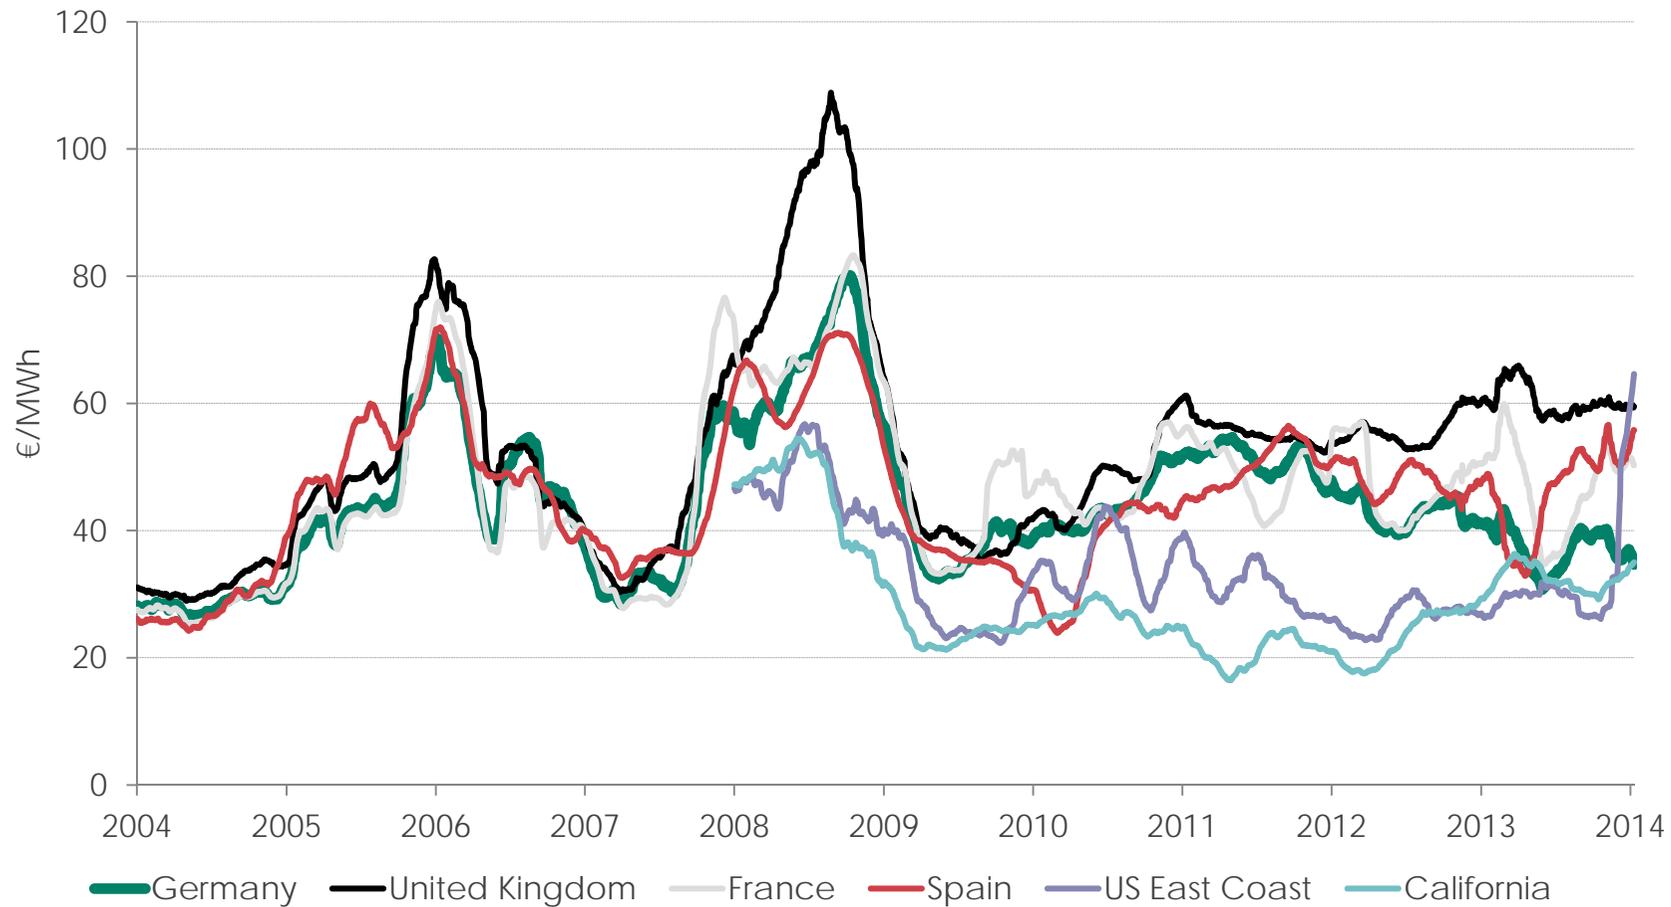

In 2013 70% of solar deployment was outside of Europe.

DIW Berlin Calculations based on REN 21, 2013; EPIA, 2014; Clean Energy Regulator, 2014.

3

The price of electricity: Development of wholesale price

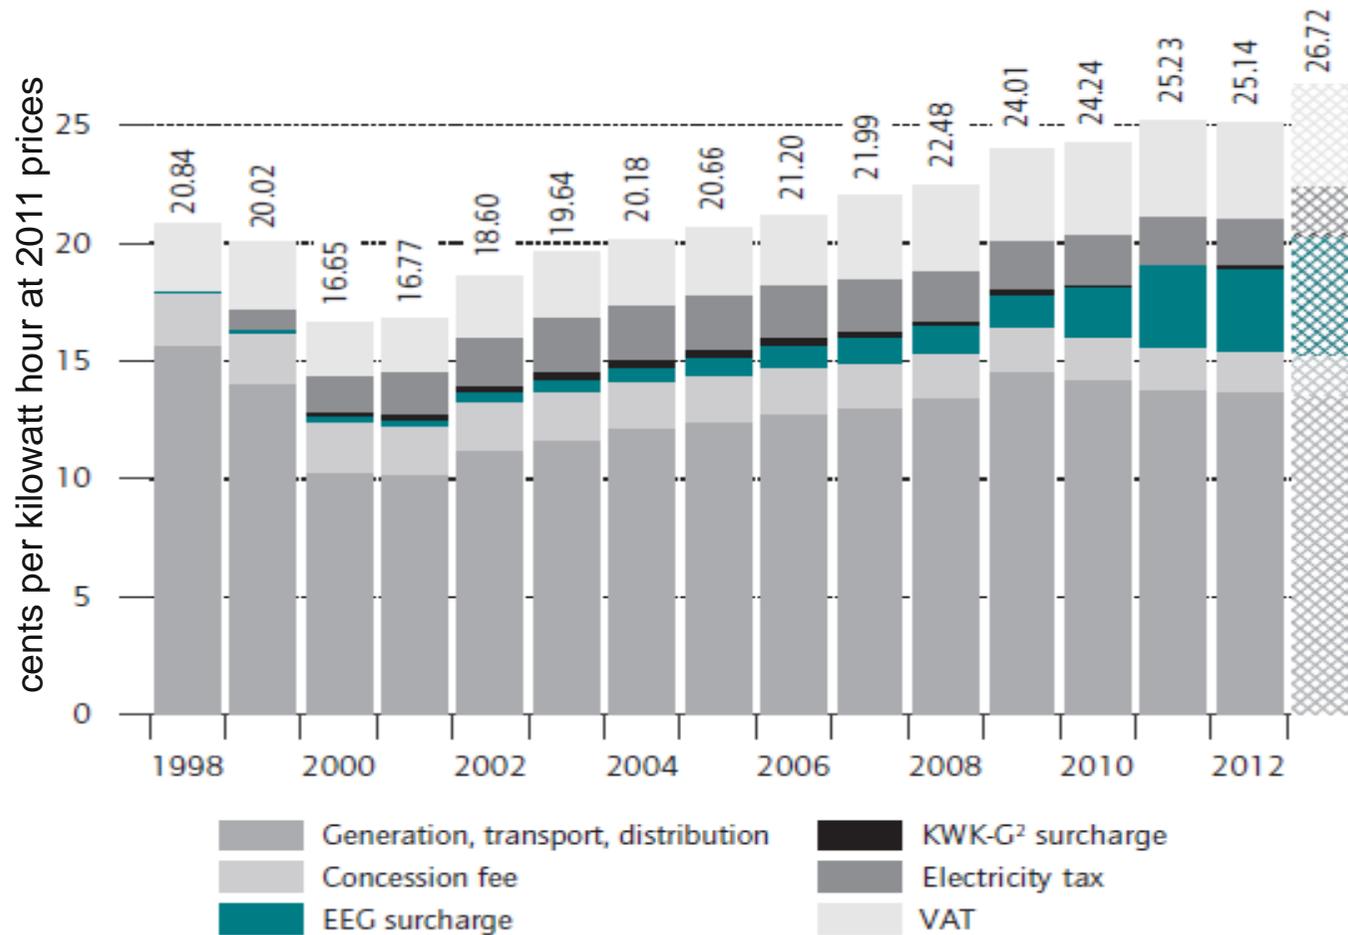

Source: Neuhoff et al. (2014): Staying with the Leaders: Europe's path to a low carbon economy.

www.climatestrategies.org. DIW Berlin Calculations based on REN 21, 2013; EPIA, 2014; Clean Energy Regulator, 2014.

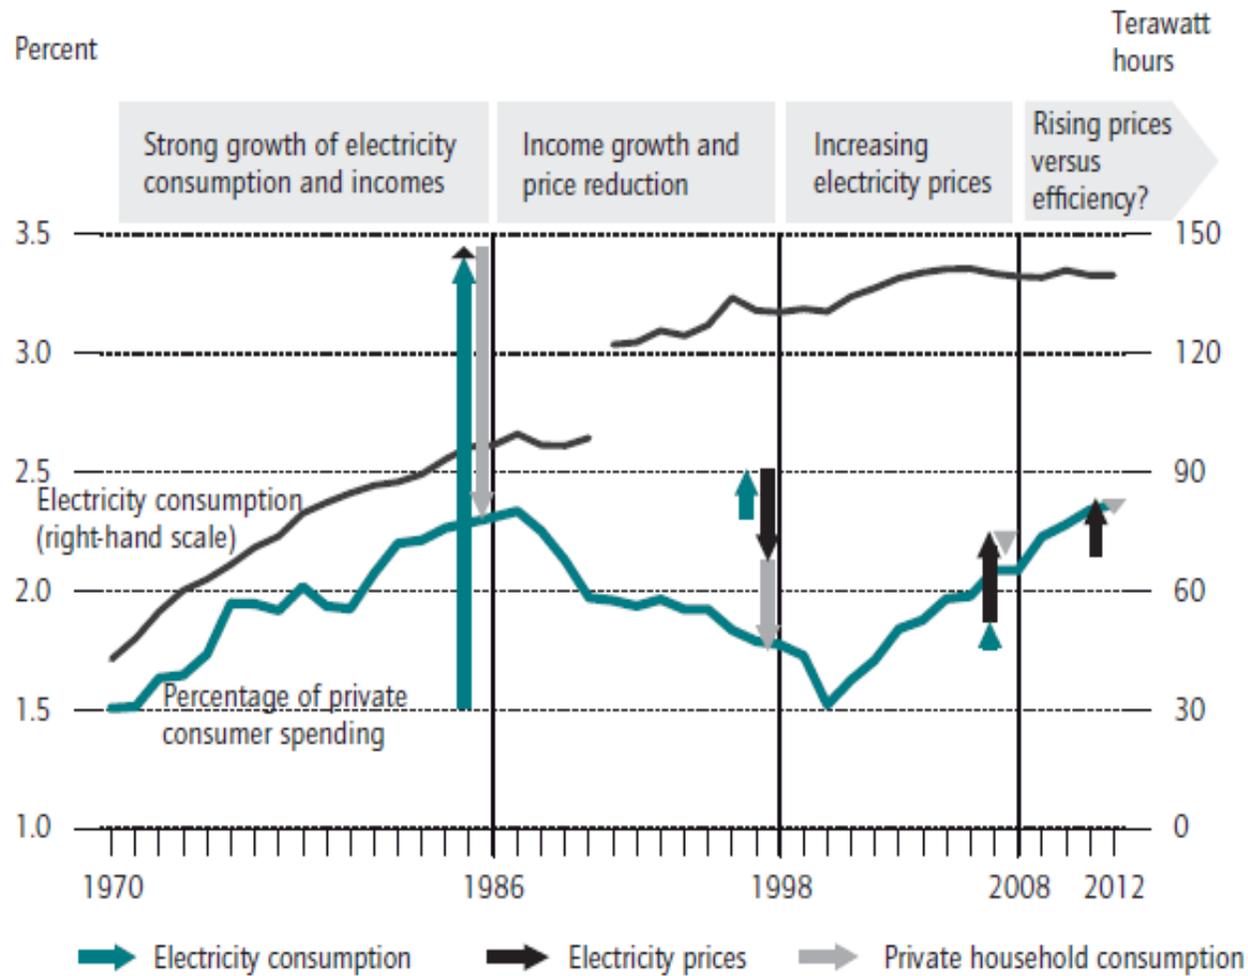

3

Development of the Electricity Price for Households

3

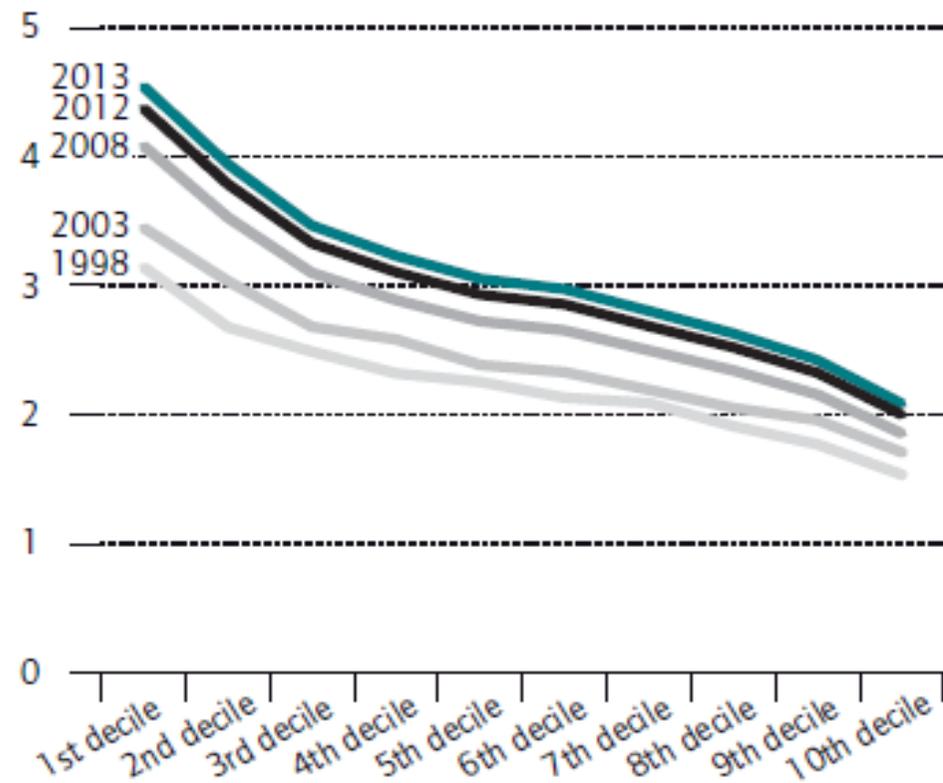

Electricity Consumption and share of Consumer Spending

3

Electricity's Share of Consumer Spending / Income Group

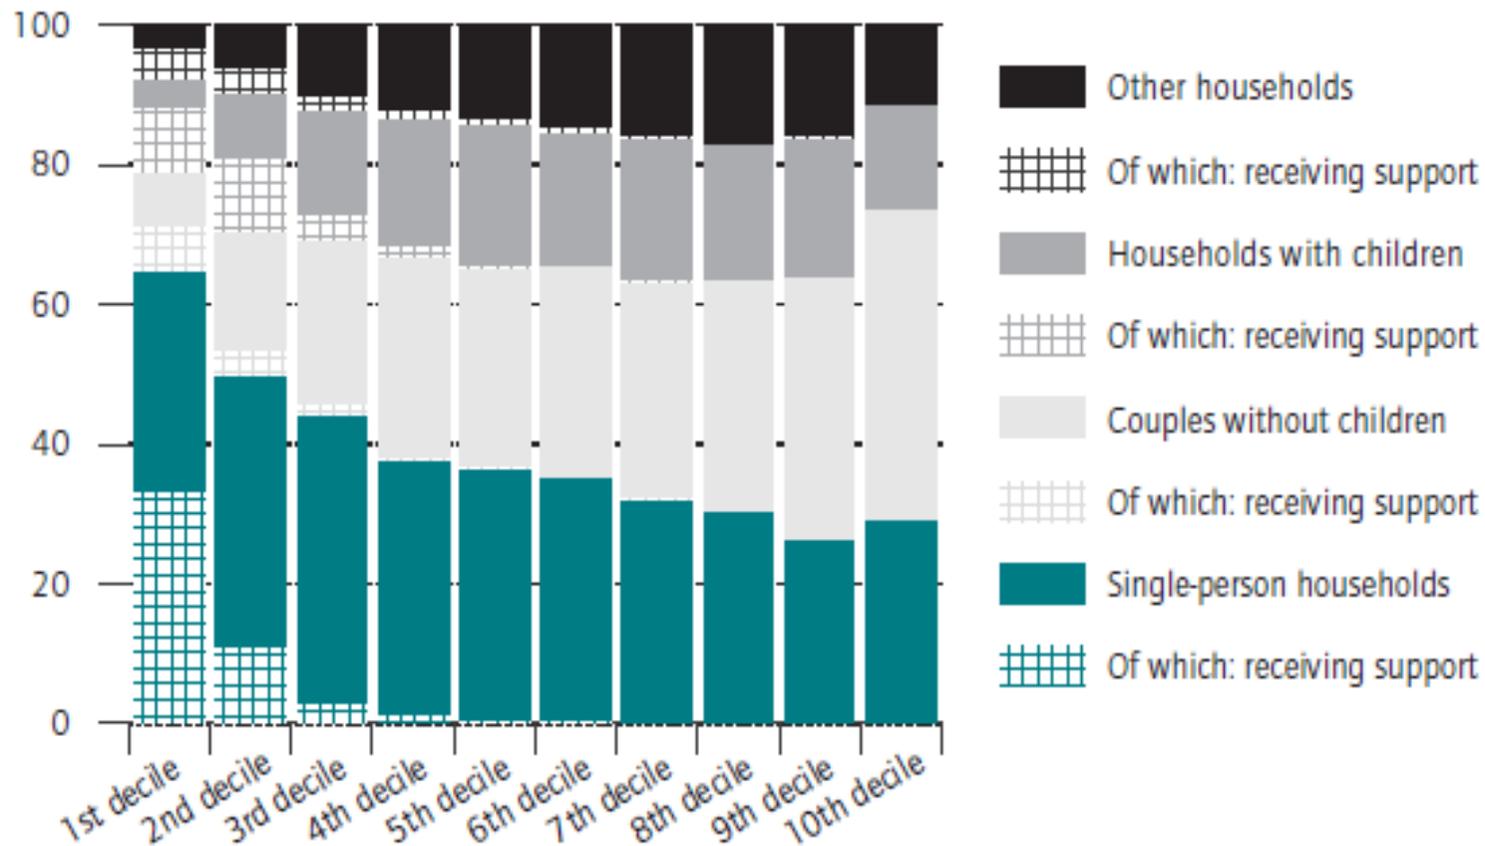

Figures in percent

4

Policy option I: Adjusting social transfers

Structure of Households by Household Types and Income

4

Option 2: Basic Tax-Free Allowance for Electricity Tax

		Treshhold of (electricity-tax) free power		
		500 KWh/a	1000 KWh/a	1500 KWh/A
Compensate increase due to feed-in	Foregone electricity tax	404 Mio € (von 2,7 Mrd €)	792 Mio €	1,14 Mrd €
	Compensation 1st Dezile	-21,7 % (47,5 Mio €)	-41,7 % (91,2 Mio €)	-57,7 % (126,3 Mio €)
Compensate increase due to feed-in + Adjustment of Means tested benefits	Foregone electricity tax + extra costs	608,9 Mio €	953 Mio €	1,26 Mrd €
	Compensation 1st Dezile	-65,1 % (142,4 Mio €)	-74,1 % (162,1 Mio €)	-81,2 % (177,7 Mio €)

VAT Additional income on feed-in tariff: 2012 937 Mio. Euro

(BMF auf Kleine Anfrage der Linken)

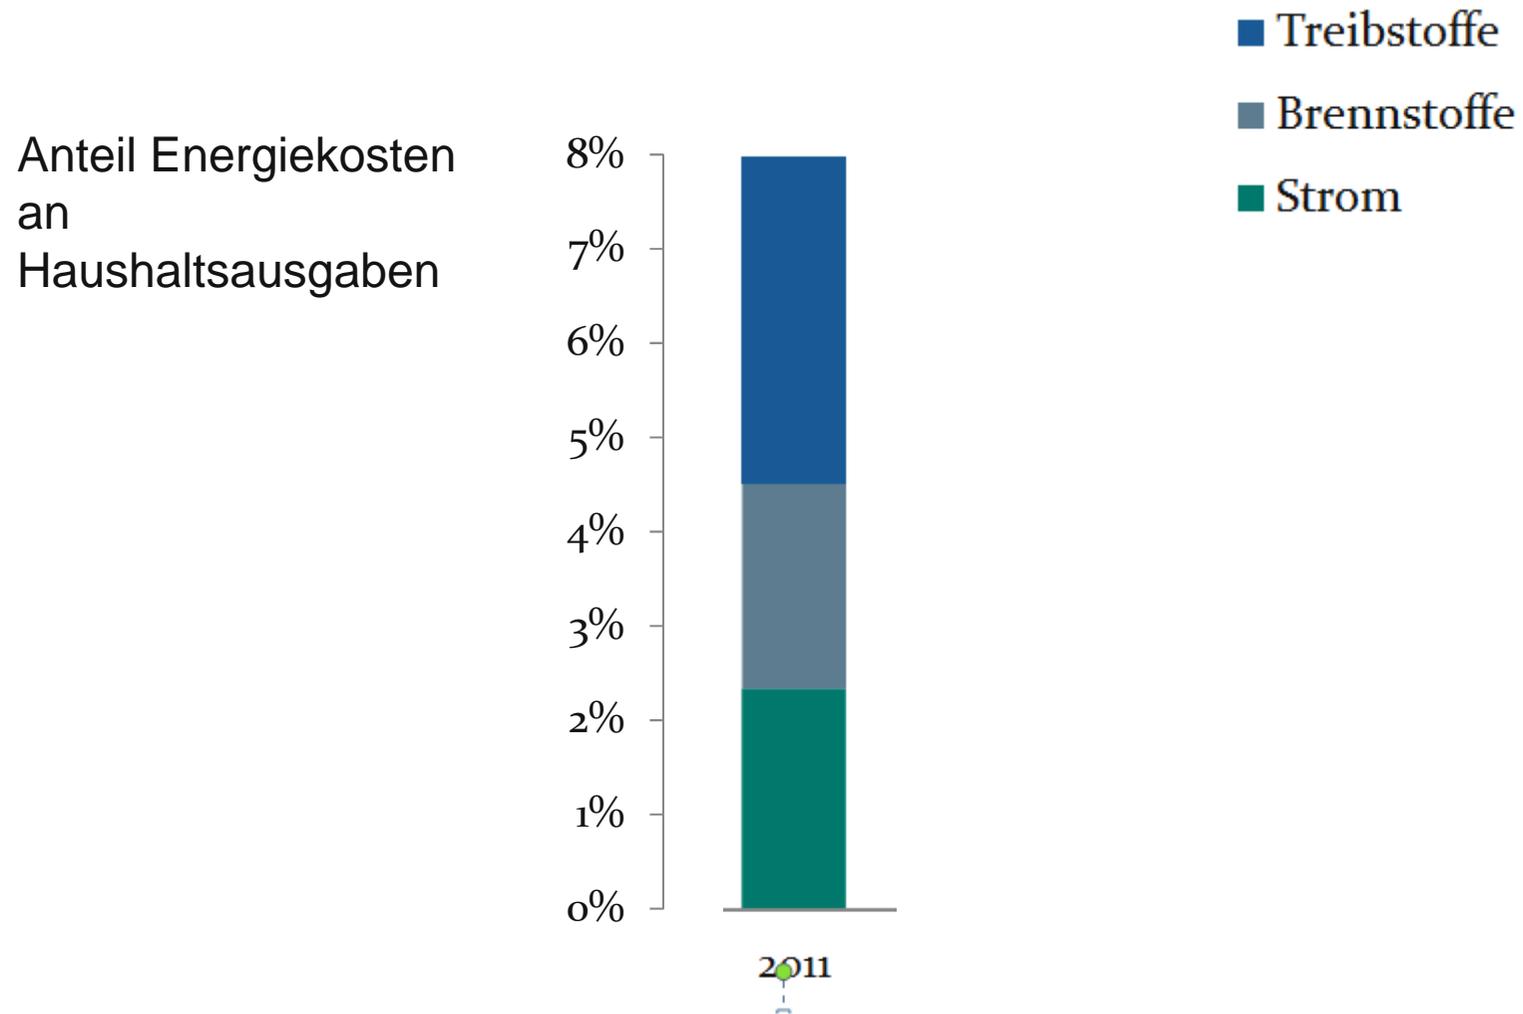

4

Option 3: Supporting HH in Using Electricity Efficiently

- Energy advice – 16% savings
- Support poor HH with fridge replacement with A++
 - ¼ older than 9 years -> 70% power savings, 64 Euro/year
 - ¼ 5-9 years -> savings, 40 Euro/year
- 300 Euro investment costs pay back in 5 and 8 years
 - With 150 grant – pay back in 2.5 and 4 years
 - One-off public expenditure of 560 Mio E (½ of 7.6 Mio HH)

4

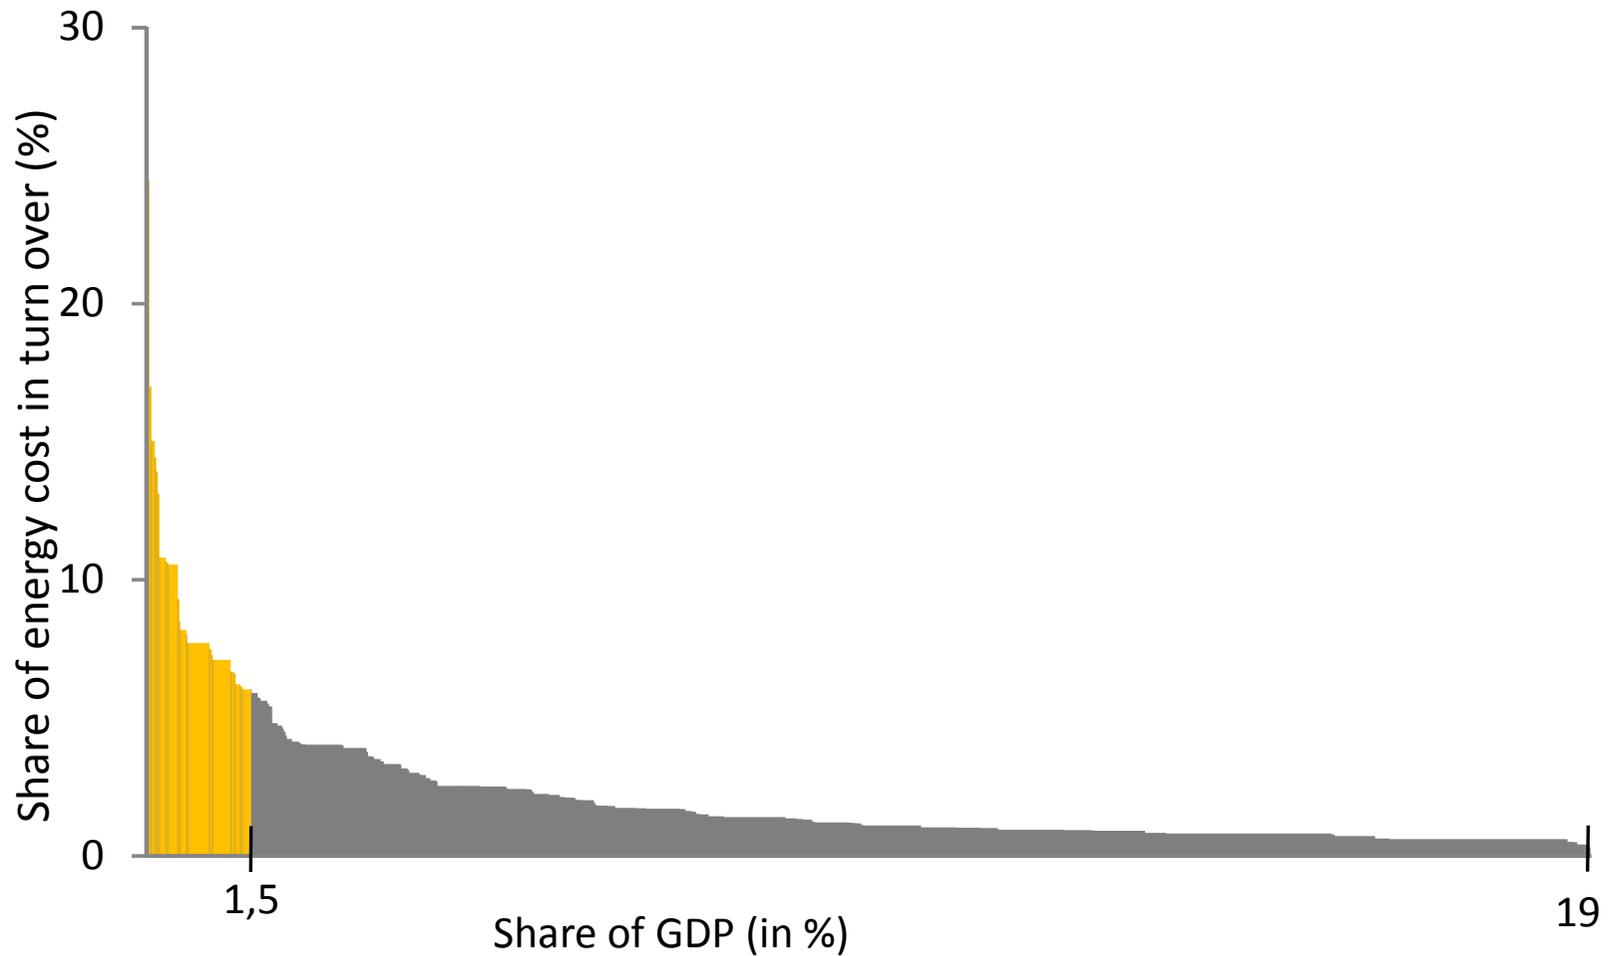

Electricity constitutes less than 1/3 of energy bill for HH

Berechnung für Brennstoffe aufbauend auf: AG Energiebilanz, IEA Energy Prices and Taxes, BMWi Energiestatistik, Stat. Bundesamt

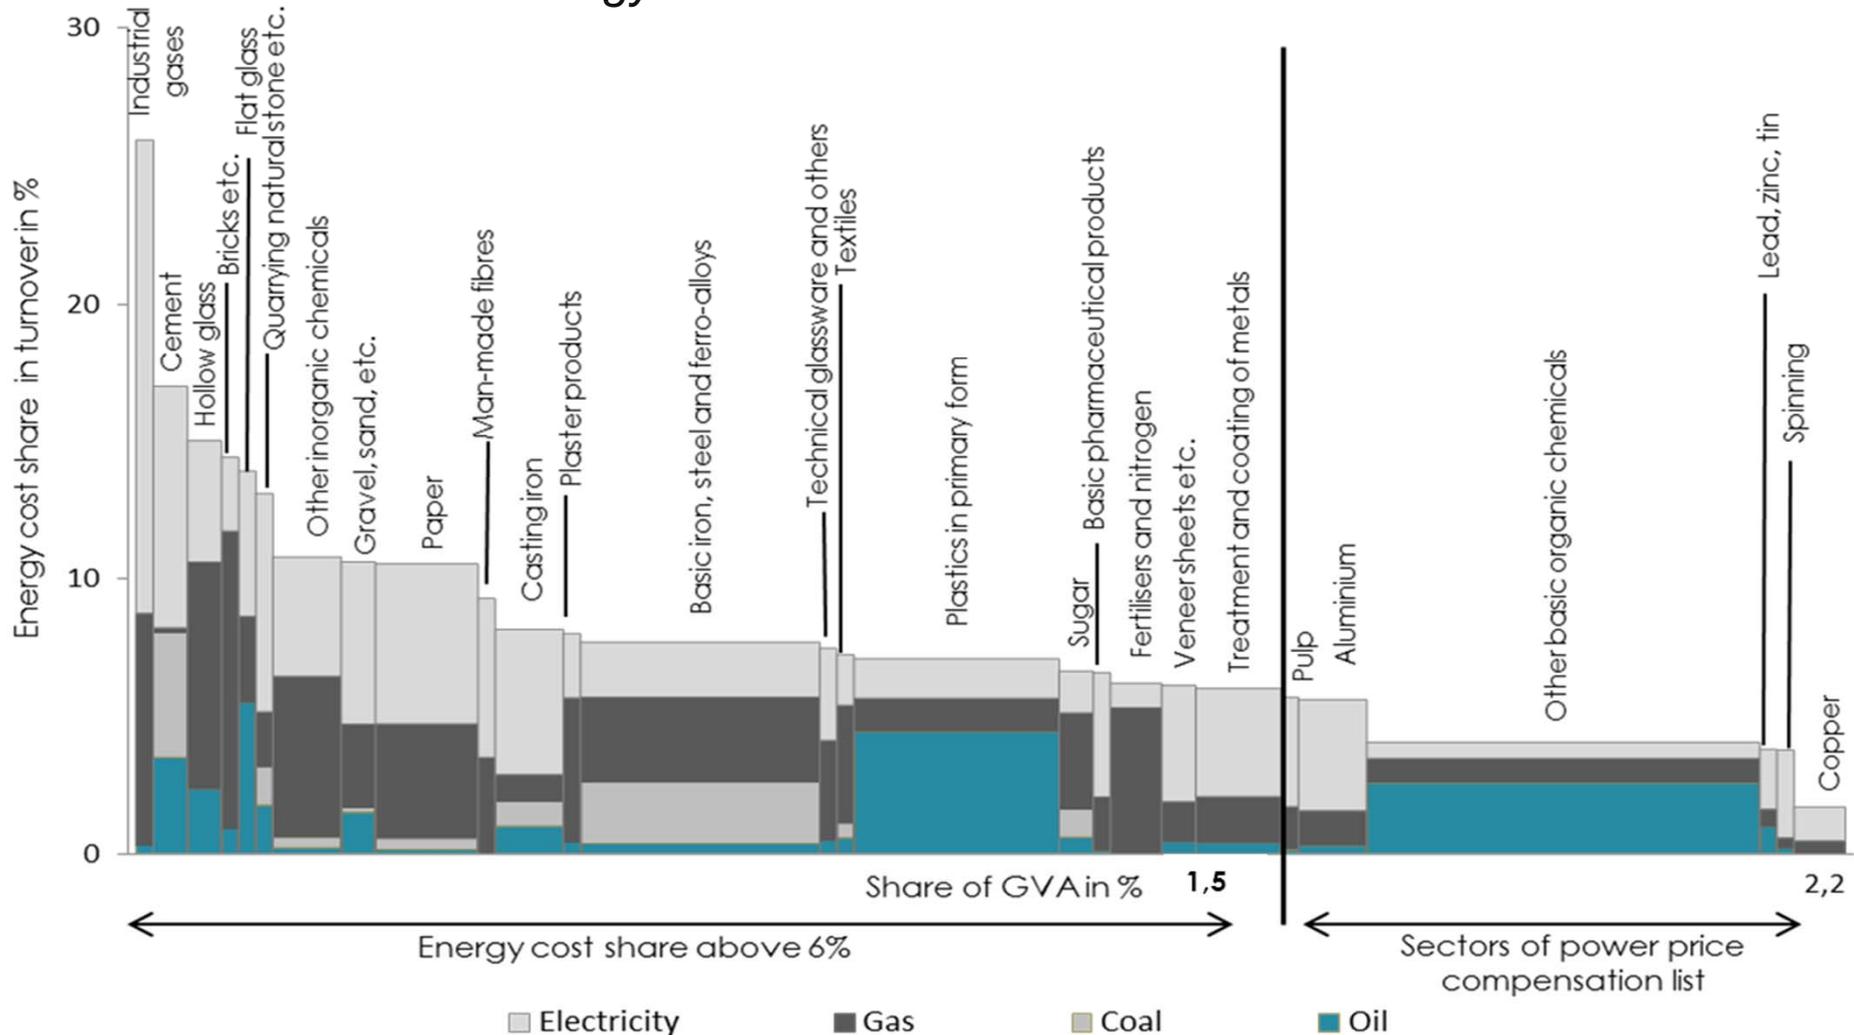

5

Share of energy cost in turn-over of manufacturing (2011)

Discussion needs to differ between very energy intensive and other activities
 Illustration: Energy cost as share of turnover by energy carrier

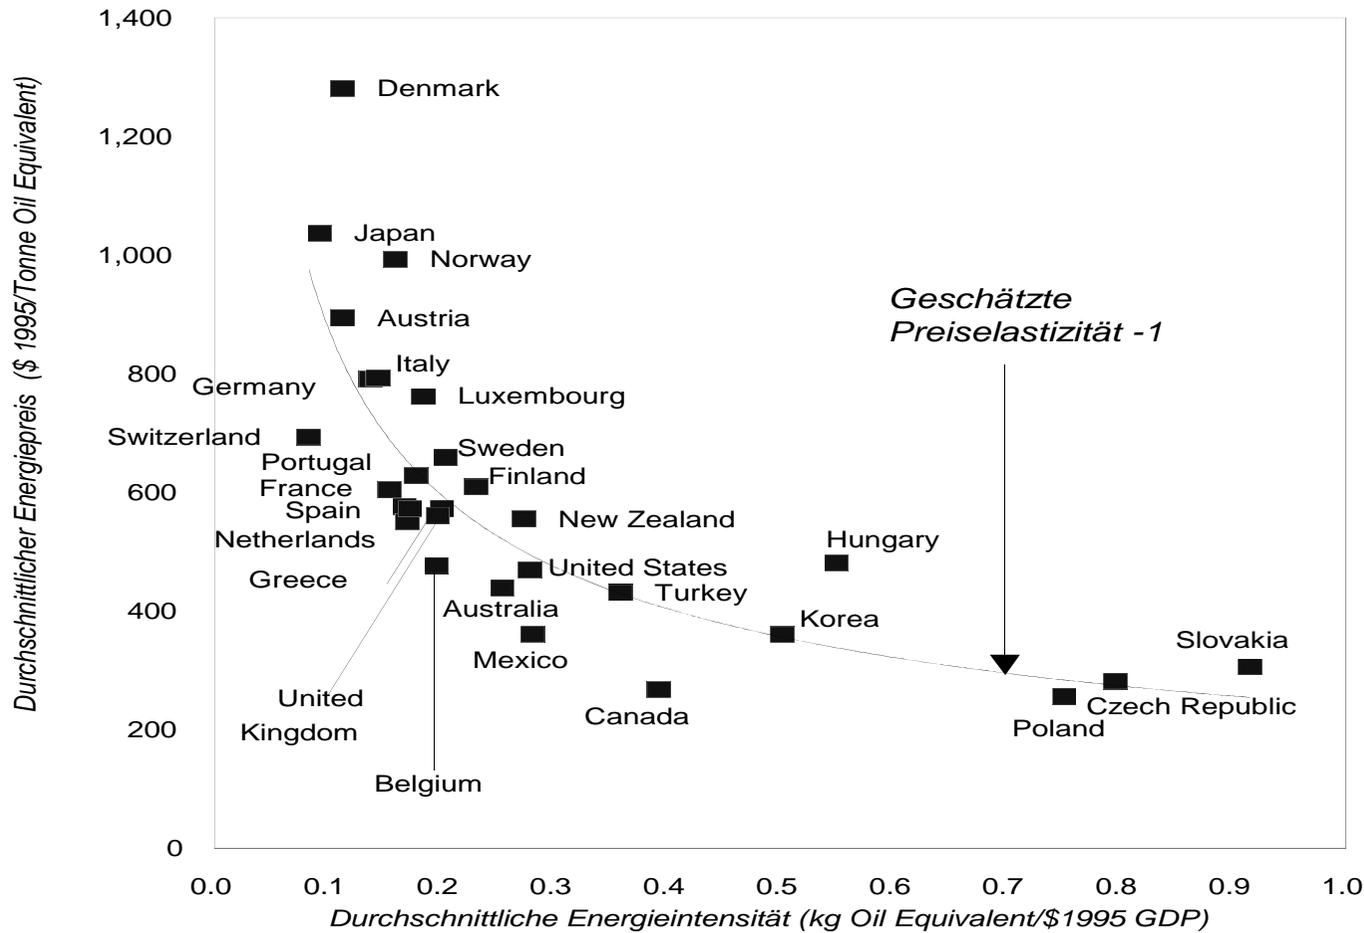

Sectors with energy costs above 6% account for less than 2% of German GVA.

Source: DIW calculations based on Destatis.

6

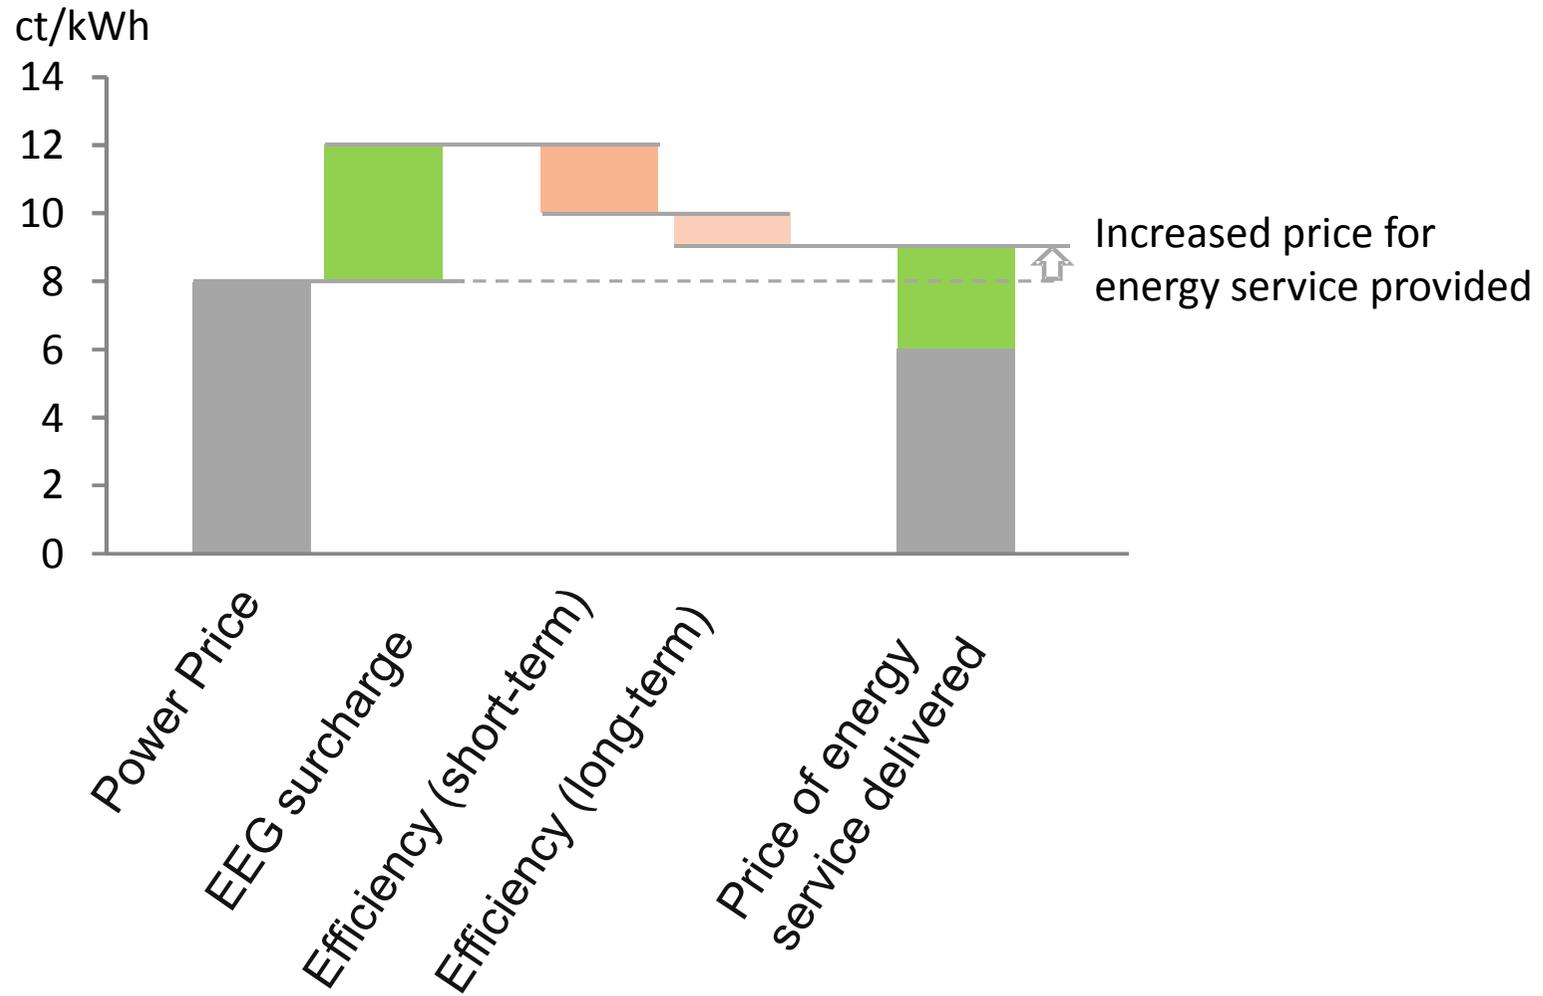

Implied costs – foregone efficiency improvements

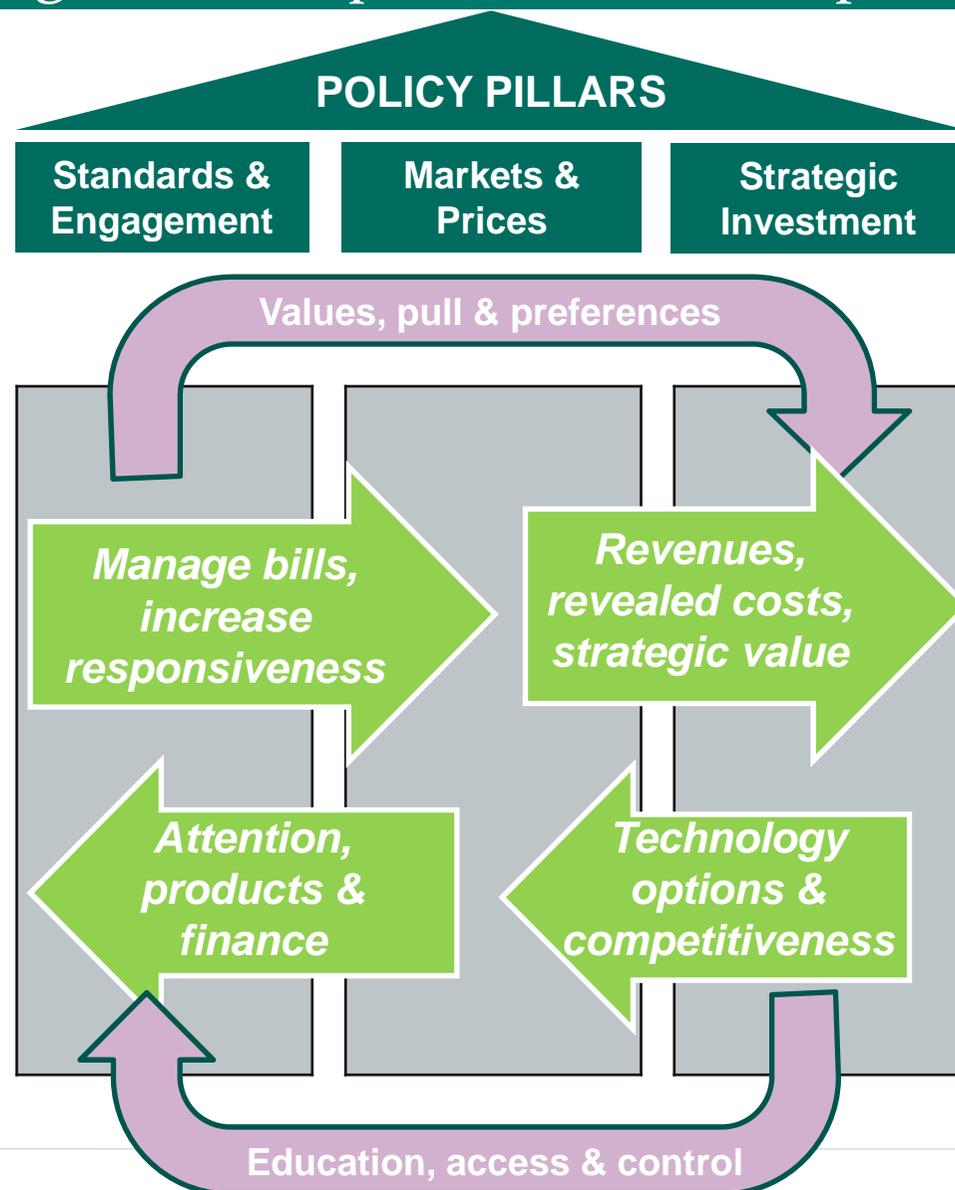

Source – Newbery 2003

6

Foregone efficiency savings

Distributional Effects of Energy Transition: Changing course requires a sustained package
